

BORON 10%

DERIVED FROM BORIC ACID

BORON 10% Advantages :

Boron is a nonmetal, micronutrient, essential to plant growth but required in minute quantities. Deficiencies are most common in humid, high-rainfall areas, particularly in the Atlantic coastal plain and the southeastern states. Boron is an activator in numerous enzyme systems in the plant. Boron is essential for the growth of new cells. It is not readily mobile in the plant, so a boron deficiency can cause the terminal bud to cease growth, followed by the death of young leaves.

Adequate Boron can be supplied by foliar applications, thus maintaining plant flowering and fruit development. Boron manages the movement and assimilation of carbohydrate levels. In cotton, this relates directly to lint and seed development.

Application Rate: Soil 1-2 gallons Foliar 1-2 quarts
