

“SUGAR ON STEROIDS”

22% SUGAR BY WEIGHT: DERIVED FROM FRUCTOSE + DEXTROSE

WILDLIGHT® is a proprietary blend of complex carbohydrates, simple sugars, and biologically derived components designed to enhance plant performance and vigor, especially when partnered with a Crop Excellence® nutritional solution.

WILDLIGHT® utilizes a SUGAR BASED formulation to increase plant vigor and energy aiding in nutrient efficiency inside the plant. Carb supplementation throughout the growing season is beneficial to soil microbes (soil application) as well as growing crops (foliar-application) by supplying readily available energy and carbon.

WILDLIGHT® simple sugars and complex carbs provide both an immediate energy source as well as a more sustained carbon source, respectively.

IN-FURROW APPLICATION (RATE: 1 QT/ACRE)

WILDLIGHT® provides Humic/Organic acids for soil conditioning, improvement of microbial activity to aid germination, emergence, and stress tolerance in developing seedlings. We've seen great response to the **WILDLIGHT® + UNDERTOW®** combination in corn and soybeans so far this year from emergence timing and uniformity, as well as overall increased plant biomass.

FOLIAR APPLICATION (RATE: 1 QT/ACRE)

WILDLIGHT® provides sugar as a rapid energy source during peak demand/growth as well as a Humic/Carbon source for increased metabolism of other Crop Excellence® applied foliar products, such as: **CELP™ 4-0-9**, **TENTACLE®**, **Boron X-TREME®** + **Mn X-TREME®**.
